- **Preparation -** The first step in the process is to prepare the sample. This involves washing the sample with distilled water to remove any surface contaminants. The sample is then dried in a vacuum oven at 60°C for 24 hours to remove any moisture. The dried sample is then weighed and placed in a pre-weighed container for analysis.
- **Analysis -** The sample is analyzed using a gravimetric method. The sample is placed in a pre-weighed crucible and heated in a muffle furnace at 550°C for 2 hours. The weight of the residue is then measured and compared to the initial weight of the sample to determine the percentage of residue.

## **What are the factors that affect the results of the analysis?**

The results of the analysis can be affected by several factors, including the quality of the reagents, the accuracy of the weighing process, and the stability of the furnace. It is important to use high-purity reagents and to calibrate the weighing scale regularly. The furnace should be pre-heated to the desired temperature before the sample is placed in it, and the sample should be cooled in a desiccator to avoid moisture uptake.

- **Quality of reagents -** The quality of the reagents used in the analysis can significantly affect the results. It is important to use high-purity reagents and to store them in a dry, dark place to avoid degradation.
- **Accuracy of weighing -** The accuracy of the weighing process is crucial for obtaining reliable results. The weighing scale should be calibrated regularly and the sample should be weighed in a dry, draft-free environment.
- **Stability of the furnace -** The furnace should be pre-heated to the desired temperature before the sample is placed in it, and the temperature should be stable throughout the analysis. The furnace should be cooled to room temperature before the sample is removed.
- **Moisture uptake -** The sample should be cooled in a desiccator to avoid moisture uptake. The desiccator should contain a drying agent, such as calcium chloride, to maintain a low humidity environment.
- **Residue composition -** The composition of the residue can affect the results. The residue should be analyzed using a suitable method, such as gravimetric analysis, to determine its composition.

If you have questions or concerns, contact your healthcare provider. A member of your care team will answer Monday through Friday from 9 a.m. to 5 p.m. Outside those hours, you can leave a message or talk with another MSK provider. There is always a doctor or nurse on call. If you're not sure how to reach your healthcare provider, call 212-639-2000.
